DID YOU KNOW?

No More Quagga

The Quagga was a subspecies of the zebra that was hunted to extinction. It was distinguished from other zebras by its limited pattern of primarily brown and white stripes, mainly on the front part of the body. The rear was brown and without stripes, and appeared more horse-like. The last captive specimen died in Amsterdam in 1883. Only one quagga was ever photographed alive, and only 23 skins still exist today.
